ASSIGNMENT-3

A Varun Naik - EE22BTECH11004

Question 16.2023: Let X be a random variable with probability density function $f(x) = \begin{cases} \alpha \lambda x^{\alpha - 1} e^{-\lambda x^{\alpha}} & \text{if } x > 0\\ 0 & \text{otherwise} \end{cases}$ If the median of

X is 1 and the third quantile is 2 then (α, λ) equals **Solution:** The third quantile is defined as

$$F(2) = \Pr\left(X \le 2\right)$$

The median is defined as

$$F(1) = \Pr\left(X \le 1\right)$$

$$Given, F(1) = \frac{1}{2} \tag{1}$$

$$F(2) = \frac{3}{4} \tag{2}$$

$$F(x) = \int_{-\infty}^{x} f(x)dx \tag{3}$$

$$x \le 0, F(x) = 0 \tag{4}$$

$$F(x) = \alpha \lambda \int_0^x x^{\alpha - 1} e^{-\lambda x^{\alpha}} dx$$
 (5)

$$let, x^{\alpha} = y \tag{6}$$

differentiate both sides

$$\alpha x^{\alpha - 1} dx = dy \tag{7}$$

$$F(x) = \lambda \int e^{-\lambda y} dy$$

$$= -e^{-\lambda y}$$

$$F(x) = \left(-e^{-\lambda x^{\alpha}}\right)_{0}^{x}$$

$$F(x) = 1 - e^{-\lambda x^{\alpha}}$$
(10)

$$= -e^{-\lambda y} \tag{9}$$

$$F(x) = \left(-e^{-\lambda x^{\alpha}}\right)_{0}^{x} \tag{10}$$

$$F(x) = 1 - e^{-\lambda x^{\alpha}} \tag{11}$$

$$F(1) = \frac{1}{2} \tag{12}$$

$$\Rightarrow \frac{1}{2} = 1 - e^{-\lambda} \tag{13}$$

$$\lambda = \ln 2 \tag{14}$$

$$F(2) = \frac{3}{4} \tag{15}$$

$$\Rightarrow \frac{3}{4} = 1 - e^{-\lambda 2^{\alpha}} \tag{16}$$

$$\alpha = 1 \tag{17}$$
